Make sure you choose the right revision of the motherboard. Page 2 Hello, I recently purchased THESI LGA1155/Intel H61/DDR3/A'GbE/MicroATX Motherboard H61M-P31 (W8) from amazon.com to use my current system (pre-built) in the case of ATX/mATX. Here's a link to the officlal MSI page for it. Here are my system specifications: Processor: Intel Core i7 2600 Memory: 8GB DDR3-1333 OS: Windows 7 64-bit PSU: EVGA 650w Gold Standard HDD: 2TB SATA HDD Optical Reader: SuperMulti DVD Burner Drive and my previous motherboard was Camel2. After I plugged my system I finally hit the power button and shot it. THE MSI Splash Screen is turned on and then after the POST final Starting Windows logo lights up, but before the four lights can combine and make the Windows logo, the system freezes, the blue screens, and then reboots, and continues to do so until I turn it off, or go to bios etc. I've already tried flashing bios through the 3.6 update (the latest version of BIOS), but it hasn't done any good, it still loops. I would like to know if this could be a hard drive because before it goes on the Starting Windows download sequence, it asks me to either start a box normally, or diagnose it. So I tried to plug in another hard drive and it still didn't download past Windows Running. I've also tried downloading in safe mode, it loads a couple of drivers before it just crashes and restarts. Can the motherboard itself be defective in some way? Or maybe there's a small compatibility problem? This system worked perfectly in front of hand. Thank you for your time. Page 3 I have a Gigabyte 78LMT-USB3 motherboard along with the AMD Radeon HD 6450 1GB DDR3 Sapphire Edition GPU. How can I see my on-board graphic memory only, rather than the graphic memory combo of the motherboard and GPU? 0 Disable the graphics card, connect the monitor to the onboard and check if it works. 0 Disable the graphics card, connect the monitor to the onboard and check if it works. Page 4 I'm going to update my motherboard from sabertooth z77. I use most of my time games and the motherboard needs to maintain high-end graphics cards, a 5.1 speaker and a 2K monitor. any offer? Thank you. Why not switch to No.87 Sabretooth? It has the usual Asus high quality componenets, and is a rock solid board (as I'm sure your aware). I think it really depends on your budget. If you want to pay the price for an excellent mid/upper range board, Sabretooth is one of my favorites. Favorite. This is assuming that your upgrade to 1150 processor. If not, I would be curious to hear why you want to upgrade with such a good motherboard? Why not switch to No.87 Sabretooth? If not, I would be curious to hear why you want to upgrade with such a good motherboard? This is actually the one I'm considering, just want to know if there are any other good maternity boards (other experiences, etc..) a long story for short; creating a 'music station' with my current processor and motherboard, so I need a new motherboard and processor. This is actually my favorite z87 board in this price range. If you want a music-oriented build then you probably want a discrete sound card. If you wanted the best sound on board I would have chosen this motherboard... it a bit pricey, but its on-board sound can rival a good discrete sound card. The audio chipset is physically separated from the rest of the motherboard, and the EMI is protected. He even uses his own divided soil. Its brilliant design. Page 5 I have MB H61 b REV 3.0 .. so I want to do an update bios 0 MB H61 b REV 3.0 is not a full motherboard brand and model name. download the cpu-z and check the name of your motherboard there. h61 is a chipset and a turnover of 3.0 means revising 3 0 to upgrade it through utility in win or in dos, check out your manufacturer mobo and choose decent tools 0 MB H61 b REV 3.0 not full brand of motherboard and model name. download the cpu-z and check the name of your motherboard there. h61 is the chipset and the turnover of 3.0 means revision 3 Page 6 hi guys I plan to buy ASRock H77M Micro ATX LGA1155 Motherboard, but I want to know first, if this motherboard has the ability to disperse Thank You 0 You will not be able to disperse with this mobo 0 You will not be able to disperse with this mobo well thanks there is a good dispersal mobo around this price range? ($64) 0 No, the motherboards that can be used to disperse will require costs of $100 for the z77 chipset. Reputable mobo to disperse at a low price will be Asrock No 77 Extreme4 0 No, the motherboard that can be used to disperse will require a cost of $100 for the z77 chipset. Thanks to Page 7 experts call , Is Gigabyte Ga-P75-D3 good when I use its crossfire option as tee has 2 PCI-E slots, once run at 16x and another run on 4x (as the gigabyte site says), is it a problem for crossfiring for gaming or is it not? Please, I need to know 0 Some people will tell you different things. I have a similar motherboard gigibyte. I have two 7870 mysts. They scale very nicely. About 190%! 8x and 8x would be better off, but don't listen to people who say it's not worth the crossfire! 0 Some people will tell you different things. I have a similar motherboard gigibyte. Thanx a lot, you print the Page 8 0 deal it has a 1 fan connector processor, one case fan connector, and one fan connector system that can also be used for the fan case. 0 It has a 1 cpu fan connector, one case fan connector, and one fan connector system, which can also be used for the fan case. 0 connectors on the motherboard for 4 fans contact 3 contact RFA-120-BL will work in 4 pin slot fine. 0 0 I forgot 1 thing. When you connect 3 pins to a 4 pin fan header, in order for the fan to automatically change the speed instead of running full speed all the time you have to change the settings in bios to control the fan with voltage rather than PWM.
